Full analysis

Overview

Kingsoft Japan is an official-looking corporate website for a software and artificial-intelligence company, presenting security software, office productivity products, enterprise SaaS, AI service robots, news, recruitment information, customer support, and contact channels. Its apparent business model is the sale and support of software and enterprise services, together with AI-robot rentals and related commercial offerings.

Scam/Impersonation Risk

No contradictions were observed: the available evidence contains no phishing, impersonation, malicious-content, or blacklist findings. The homepage presents a coherent corporate profile under the Kingsoft Japan name, with company information, product pages, news, recruitment, support, and contact functions rather than an anonymous or investment-oriented solicitation. Browser activity produced some non-whitelisted network requests, DOM changes, and console errors, but there were no hidden forms, password submissions to external destinations, cloaking, wallet activity, or other abuse patterns; these signals are therefore best treated as implementation or integration irregularities rather than evidence of impersonation. The real-world operator identity remains likely rather than independently verified.

EVIDENCE

- Homepage: corporate title, company navigation, product and service categories, recruitment, support, news, and contact functions are present.
- Homepage behavior: 34 external XHR requests and 29 external POST requests were observed across two successful runs; no hidden forms or external password forms were detected.
- Homepage behavior: 24 console errors and a maximum post-interaction DOM difference of 1,528 were recorded, while cloaking, wallet-provider, wallet-drainer, and clipboard-hijacking activity were not detected.
- External reputation assessment: 0 malicious and 0 suspicious detections were returned, with the domain ranked 45148 and included in the top 1 million sites.

Regulatory Verification Notes

The legal and corporate sections provide substantive identity-related content, including company overview, mission, history, officer information, corporate conduct, diversity and inclusion, CSR, certifications, office access, recruitment, and contact information. The site describes products such as WowTalk, Wonder Cloud Works, Kingsoft Security Care+, CAMCARD BUSINESS, and the LANKY PORTER and Lanky Mini AI robots, alongside enterprise SaaS and cloud-security offerings. No regulated financial-service affiliation or license claim is presented in the supplied evidence; this is a verification point if a proposed engagement involves a regulated

activity, but it is not evidence of a scam. The site's corporate presentation, established product coverage, social presence, clean external reputation, and mainstream technical deployment are collectively consistent with an established website, while not independently proving the operator's legal identity.

EVIDENCE

- Corporate and company-information pages: sections for company overview, mission, history, officers, conduct charter, CSR, certifications, offices, recruitment, support, and contact are available.
- Homepage product and service content: software, enterprise SaaS, security products, business communications, and AI-robot services are presented as the commercial offering.
- Transport security: TLS uses Starfield Secure Certificate Authority - G2 with DV validation and is valid to 2026-09-28T06:26:22+00:00.
- External reputation assessment: `tranco\_in\_top\_1m=true`, `tranco\_rank=45148`, `vt\_malicious=0`, `vt\_suspicious=0`, and `gsb\_malicious=false`.

What to Verify Next

Before credential or payment interactions, an enterprise or consumer should independently confirm the legal entity and authorized contact channels through a corporate registry or an offline route, and review the applicable merchant, subscription, cancellation, return, and payment-protection terms. If any service is proposed as regulated or financial in nature, its authorization should be confirmed directly with the relevant regulator rather than inferred from the website's corporate presentation.

EVIDENCE

- Company-information pages: legal and operational sections are available for comparison against independently obtained corporate records.
- Product and service pages: multiple commercial offerings are identified, providing specific names to use when confirming the contracting entity and applicable terms.
- Contact and support pages: official communication routes are published for independent channel confirmation.

Summary Verdict

The site has a **high-trust, low-risk posture** and the evidence is consistent with an established, apparently legitimate corporate website. No scam or impersonation contradiction was identified, although the available evidence does not independently verify the real-world operator identity.

Infrastructure Integrity

The website is protected by AWS CDN/WAF infrastructure, with the observed address served from the CDN edge and no origin-server candidate identified. This is a positive exposure-control measure that reduces direct origin visibility, but it is a mitigating infrastructure signal rather than proof of legitimacy.

EVIDENCE

- Hosting infrastructure: Served from AS16509 through AMAZON-02 - Amazon.com, Inc., US; observed address 13.231.19.118.
- Transport encryption: TLS certificate issuer is Starfield Secure Certificate Authority - G2, validation level DV, valid through 2026-09-28T06:26:22+00:00.
- Infrastructure posture: 1 unique observed IP, 1 CDN edge IP, and 0 likely origin IPs were identified; AWS CDN/WAF protection was detected.

Closing Assessment

Ordinary browsing and standard business interaction are proportionate to the current assessment; credentials or payments should follow the ordinary independent identity, terms, and payment-protection checks appropriate to the proposed transaction.

Written analysis generated 2026-08-11 by the TrustSniffer Analysis Engine from the evidence in this report.

What the analysis found

No rule findings contributed to this verdict.

Identity verification

Status	LIKELY
Identity score	76/100
Identity verification confidence	76%

- Trusted social count=2

Identity verification measures whether the site can be independently connected to a real-world brand or person. It is separate from the classification confidence.

What TrustSniffer observed

First-party facts recorded during the assessment of kingsoft.jp.

- The request stayed on kingsoft.jp. It was not redirected to another domain. [CLEAR](#)
- It is hosted on AMAZON-02, from a server in US. [NOTED](#)

About this assessment

A trust score summarises the evidence TrustSniffer could collect about kingsoft.jp at assessment time. It is a starting point for your own judgement, not a guarantee: a high score means the signals were consistent with a legitimately operated site, a low or critical score means several risk patterns were present.

TrustSniffer assesses a website from the evidence it can collect at a point in time: domain registration and age, hosting and certificate, the content the site served, and third-party reputation feeds. A score is a summary of that evidence, not a guarantee and not a legal finding. There is no human rating and no user review in it. A site can change after it is assessed.
